Welcome to the mpmX RCA Bot! Type your questions below to interact with your process mining data.

A

Welcome to the mpmX RCA Bot!

I am your hybrid AI assistant for data analysis and interactive root cause analysis. Here's how I can help:

-  **Deep RCA (Precomputed):** Access machine-learning generated RCA reports to find complex root cause which I will translate into business insights and recommendations.
-  **Live RCA (Ad Hoc):** Select a problem, such as Lead Time Missed or Low Automation Rate, and I will perform statistical analysis and interpret the results for root causes.
-  **Automated SQL Queries:** I can generate and run SQL queries against the mpmX process data if you want to double check the root causes I found.

Ask me a Question and let's get started!

Deep RCA for All Targets

A

Executive Summary

Our analysis has identified 34 distinct patterns across various process problems, with a range of priority levels from high to low and affecting between 1.1% to 25.1% of cases. These patterns highlight opportunities for improvement in areas such as invoice processing, logistics, and material management. By addressing these issues, the company can reduce manual errors, delays, and potential penalties, ultimately leading to increased efficiency and cost savings.

Cluster Analysis

Cluster 1: Low Automation Rate in Reutlingen or Packaging Spend Area ● HIGH

- **Problem:** Low automation rate leads to inefficient processing of invoices from specific suppliers in Reutlingen or packaging spend area.
- **Impact:** 13.25% of cases, Confidence: 0.96
- **Examples:** Supplier Weyh GmbH, Wenco Service Marketing GmbH & Co. KG, Jos Schneider Optische Werke GmbH, or Weinfurtner Das Glasdorf.
- **Action:** Implement automated invoice processing for

these suppliers and locations/spend areas to reduce manual errors and delays.

Cluster 2: Reworked Cases due to Duplicate Payments and Missed Target Times MEDIUM

- **Problem:** Reworked cases are more likely to occur when there are duplicate payments, missed order to goods receipt target times, and standard item categories.
- **Impact:** 10.13% of cases, Confidence: 0.848
- **Examples:** Duplicate payment, order to goods receipt target time missed, item category standard.
- **Action:** Implement a more efficient payment processing system, improve inventory management, and optimize material sourcing to reduce reworked cases.

Cluster 3: Missed Lead Times in Logistics Spend Area HIGH

- **Problem:** Inefficient logistics spend area processes lead to missed lead times, resulting in delayed deliveries and potential revenue loss.
- **Impact:** 1.14% of cases, Confidence: 0.869
- **Examples:** Missed lead time and logistics spend area.
- **Action:** Implement a logistics process optimization project to streamline and automate logistics spend area processes.

Cluster 4: Low Automation Rate in Sales Spend Area MEDIUM

- **Problem:** Low automation rate leads to inefficient processing of invoices for indirect materials in sales spend area.
- **Impact:** 24.80% of cases, Confidence: 0.776
- **Examples:** Material type indirect material and spend

area sales.

- **Action:** Implement automated invoice processing for indirect materials in sales spend area to reduce manual errors and delays.

Cluster 5: Missed Lead Times in Consignments

HIGH

- **Problem:** Invoices associated with consignments may cause delays in processing, leading to missed lead times.
- **Impact:** 5.6% of cases, Confidence: 0.974
- **Examples:** Consignments with associated invoices.
- **Action:** Implement a streamlined invoicing process for consignments to reduce delays.

Cluster 6: Low Process Governance in Service Item

Category  MEDIUM

- **Problem:** Inefficient service item category processes lead to missed lead times, resulting in delayed deliveries and potential revenue loss.
- **Impact:** 1.28% of cases, Confidence: 0.804
- **Examples:** Service item category and missed lead time.
- **Action:** Implement a service process optimization project to streamline and automate service item category processes.

Cluster 7: Missed Invoice to Payment Target Time in Sales Spend Area MEDIUM

- **Problem:** Delayed payments for indirect materials or products for resale in the sales spend area may lead to increased costs and strained supplier relationships.
- **Impact:** 23.6% of cases, Confidence: 0.795
- **Examples:** Indirect materials in sales spend area or

products for resale.

- **Action:** Implement automated payment processing for indirect materials and products for resale in the sales spend area to reduce manual errors and delays.

Key Recommendations

Immediate Action (High Priority):

1. Implement automated invoice processing for suppliers in Reutlingen or packaging spend area to reduce manual errors and delays.
2. Implement a logistics process optimization project to streamline and automate logistics spend area processes.
3. Implement a streamlined invoicing process for consignments to reduce delays.

Medium-Term Fixes:

1. Implement a more efficient payment processing system, improve inventory management, and optimize material sourcing to reduce reworked cases.
2. Implement automated invoice processing for indirect materials in sales spend area to reduce manual errors and delays.
3. Implement a service process optimization project to streamline and automate service item category processes.
4. Implement automated payment processing for indirect materials and products for resale in the sales spend area to reduce manual errors and delays.

One exceptional pattern worth noting is the high lift (>20) and low support (<5%) in Cluster 1, indicating a very specific and identifiable pattern that should be relatively straightforward to address.
